

## Heating tunnel

We offer a heating tunnel which leads to an improved heating of the material web. Through more evenly distributed heating of the material film, the process for part forming is improved and thus the formed part quality is increased. As a result of the complete shielding of the heating area the power consumption is reduced.

### Your benefits

- | Increased formed part quality through improved wall thickness distribution
- | Minimization of radiation losses to the work environment
- | Uniform heating during the infeed
- | Reduction of power consumption
- | Protection of the material film against contaminants

### Available for machines
